Univariate

Definition: Univariate data analysis focuses on a single variable or dataset, examining its characteristics and distribution.

Objective: The primary goal is to describe and summarize the data, understand its central tendency, and identify patterns, outliers, and potential trends within that single variable.

Methods: Common methods include histograms, bar charts, box plots, summary statistics (mean, median, mode), and measures of dispersion (variance, standard deviation)

```
plt.figure(figsize=(12, 10))

plt.subplot(4, 2, 1)
plt.plot(df['total'], 'b')
plt.title('Total')

"""

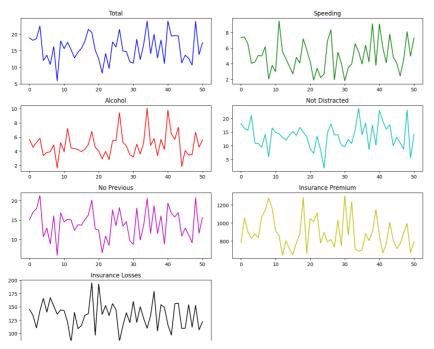

Total (Blue Line):
The graph shows the trend in total car crashes over the dataset.
Inference: There is a noticeable variation in the total number of car crashes over time, but no specific pattern emerges.
"""

plt.subplot(4, 2, 2)
plt.plot(df['speeding'], 'g')
plt.title('Speeding')

"""

Speeding (Green Line):
```

```
This graph represents the trend in car crashes caused by speeding.
Inference: The number of car crashes due to speeding appears to have some fluctuations but doesn't show a consistent upward or downward t
plt.subplot(4, 2, 3)
plt.plot(df['alcohol'], 'r')
plt.title('Alcohol')
Alcohol (Red Line):
The graph displays the trend in car crashes related to alcohol consumption.
Inference: There is some variation in car crashes involving alcohol, but no clear trend is evident from the graph.
plt.subplot(4, 2, 4)
plt.plot(df['not_distracted'], 'c')
plt.title('Not Distracted')
Not Distracted (Cyan Line):
This graph illustrates the trend in car crashes where drivers were not distracted.
Inference: The number of car crashes by non-distracted drivers shows fluctuations, but no significant trend is apparent.
plt.subplot(4, 2, 5)
plt.plot(df['no_previous'], 'm')
plt.title('No Previous')
No Previous (Magenta Line):
The graph shows the trend in car crashes by drivers with no previous incidents.
Inference: Car crashes by drivers with no previous incidents appear to have some fluctuations but no discernible trend.
plt.subplot(4, 2, 6)
plt.plot(df['ins_premium'], 'y')
plt.title('Insurance Premium')
Insurance Premium (Yellow Line):
This graph represents the trend in insurance premiums.
Inference: The graph doesn't provide clear insights into the trend in insurance premiums over time, as it seems to fluctuate without a di
plt.subplot(4, 2, 7)
plt.plot(df['ins_losses'], 'k')
plt.title('Insurance Losses')
Insurance Losses (Black Line):
The graph displays the trend in insurance losses.
Inference: Similar to insurance premiums, insurance losses also appear to fluctuate without a clear trend.

Barplot

```
plt.figure(figsize=(18, 9))
sns.barplot(data=df,x='abbrev', y='total',errorbar=None)
plt.xlabel('State Abbreviation')
plt.ylabel('Total Crashes')
plt.title('Total Crashes vs. State Abbreviation')
```

Inference:

State abbreviations are on the x-axis, and the total number of crashes is on the y-axis.

The plot provides a clear comparison of car crash counts between states.

For example, states with abbreviations like "DC," "RI," and "NH" have relatively lower total crash counts, while "TX," "CA," and "FL" have This plot is useful for identifying states with higher or lower crash rates, which can be valuable for further analysis or policy conside """

'\nInference:\nState abbreviations are on the x-axis, and the total number of cra shes is on the y-axis.\nThe plot provides a clear comparison of car crash counts between states.\nFor example, states with abbreviations like "DC," "RI," and "NH" have relatively lower total crash counts, while "TX," "CA," and "FL" have higher crash counts.\nThis plot is useful for identifying states with higher or lower cr ash rates, which can be valuable for further analysis or policy consideration

```
plt.figure(figsize=(18, 9))
sns.barplot(data=df,x='total', y='speeding',errorbar=None)
plt.ylabel('Speeding')
plt.xlabel('Total Crashes')
plt.title('Total Crashes vs. Speeding')
```

Inference:

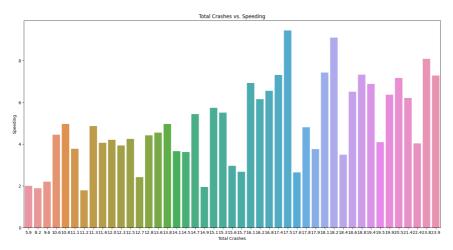

The total number of crashes is represented on the x-axis, while the number of crashes involving speeding is on the y-axis. The plot allows us to examine how speeding contributes to the overall number of car crashes.

As the total number of crashes increases, there is a general trend of an increase in the number of crashes involving speeding

As the total number of crashes increases, there is a general trend of an increase in the number of crashes involving speeding. This suggests that as the total number of car crashes goes up, the proportion of crashes involving speeding also tends to increase.

Analyzing this relationship can help in understanding the impact of speeding on overall road safety and may inform targeted interventions

'\nInference:\nThe total number of crashes is represented on the x-axis, while the n umber of crashes involving speeding is on the y-axis.\nThe plot allows us to examine how speeding contributes to the overall number of car crashes.\nAs the total number of crashes increases, there is a general trend of an increase in the number of crash es involving speeding.\nThis suggests that as the total number of car crashes goes u p, the proportion of crashes involving speeding also tends to increase.\nAnalyzing t his relationship can help in understanding the impact of speeding on overall road sa fety and may inform targeted interventions to reduce speeding-related accidents.\n'

sns.histplot(data=df, x='ins_premium', bins=20, kde=True)
plt.xlabel('Insurance_Premium')
plt.ylabel('Frequency')

plt.title('Distribution of Insurance Premium')

.....

Inference :

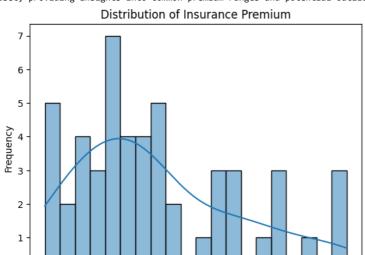

The histogram depicts the distribution of insurance premiums.

The plot shows that the most common insurance premium ranges have higher frequencies, forming peaks in the distribution.

The distribution appears to be right-skewed, suggesting that a few observations have exceptionally high insurance premiums.

This visualization aids in understanding the distribution of insurance premiums within the dataset, providing insights into common premiums

'\nInference :\nThe histogram depicts the distribution of insurance premiums.\nThe p lot shows that the most common insurance premium ranges have higher frequencies, for ming peaks in the distribution.\nThe distribution appears to be right-skewed, sugges ting that a few observations have exceptionally high insurance premiums.\nThis visua lization aids in understanding the distribution of insurance premiums within the dat aset, providing insights into common premium ranges and potential outliers.\n'

sns.histplot(data=df, x='ins_losses', bins=20, kde=True)

plt.xlabel('Insurance_Loss')

plt.ylabel('Frequency')

plt.title('Distribution of Insurance Loss')

....

Inference :

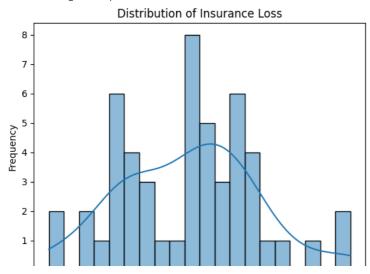

The histogram represents the distribution of insurance losses.

The plot indicates that the majority of insurance losses fall within specific ranges, with peaks in frequency.

The distribution appears right-skewed, indicating that a few instances have considerably higher insurance losses.

This visualization helps in understanding the distribution of insurance losses within the dataset, highlighting common loss ranges and po

'\nInference :\nThe histogram represents the distribution of insurance losses.\nThe plot indicates that the majority of insurance losses fall within specific ranges, wi th peaks in frequency.\nThe distribution appears right-skewed, indicating that a few instances have considerably higher insurance losses.\nThis visualization helps in un derstanding the distribution of insurance losses within the dataset, highlighting co mmon loss ranges and potential outliers.\n'

Piechart

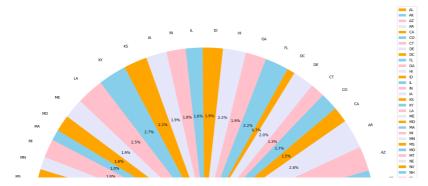

```
fig = plt.figure(figsize=(20,20))
axes1 = fig.add_axes([0.1,0.1,0.8,0.8]) # (left,bottom,width,height)
axes1.pie(df['total'],labels=df['abbrev'],autopct='%0.1f%%',colors =['orange','skyblue','pink','lavender']) # %0.1f%% specifies percentag
axes1.legend()
"""
```

The pie chart visualizes the distribution of total car crashes across different states, represented by their abbreviations. Each slice of the pie represents a state, and the size of the slice corresponds to the percentage of total crashes in that state. The labels on the chart indicate the state abbreviations.

The legend provides a key to identify which state each slice represents.

This pie chart allows for a quick comparison of the contribution of each state to the total number of car crashes in the datase

'\nInference :\nThe pie chart visualizes the distribution of total car crashes acros s different states, represented by their abbreviations.\nEach slice of the pie repre sents a state, and the size of the slice corresponds to the percentage of total cras hes in that state.\nThe labels on the chart indicate the state abbreviations.\nThe l egend provides a key to identify which state each slice represents.\nThis pie chart allows for a quick comparison of the contribution of each state to the total number of car crashes in the datase\n'

Bivariate

Definition: Bivariate data analysis involves the analysis of two variables to explore their relationship and interactions.

Objective: The primary goal is to understand how two variables are related, whether they exhibit correlation or causation, and to identify patterns or associations between them.

Methods: Common methods include scatter plots, line graphs, correlation coefficients (e.g., Pearson correlation), and hypothesis tests (e.g., t-tests) to determine if relationships are statistically significant.

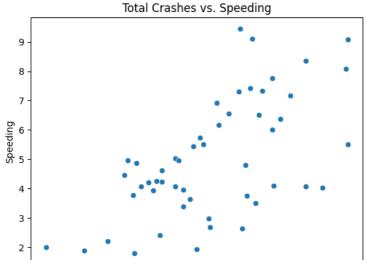

Scatterplot

```
sns.scatterplot(x="total",y='speeding',data=df)
plt.ylabel('Speeding')
plt.xlabel('Total Crashes')
plt.title('Total Crashes vs. Speeding')
"""
```

Inference :

The scatter plot visualizes the relationship between the total number of car crashes and the number of crashes involving speeding. There doesn't appear to be a strong linear relationship between total crashes and speeding incidents based on this scatter plot. The points are scattered across the plot without a clear trend, suggesting that total crashes and speeding may not be strongly correlated further statistical analysis may be needed to quantify the relationship between these variables accurately.

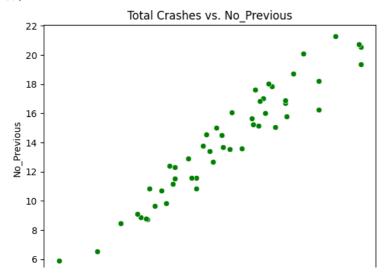

'\nInference :\nThe scatter plot visualizes the relationship between the total number of car crashes and the number of crashes involving speeding.\nThere doesn't appear to be a strong linear relationship between total crashes and speeding incidents base d on this scatter plot.\nThe points are scattered across the plot without a clear tr end, suggesting that total crashes and speeding may not be strongly correlated.\nFur ther statistical analysis may be needed to quantify the relationship between these v ariables accurately.\n'

Multivariate

Definition: Multivariate data analysis deals with the examination of three or more variables simultaneously, often in complex datasets.

Objective: The primary goal is to uncover intricate relationships, dependencies, and patterns involving multiple variables. It aims to explore how these variables collectively impact the outcome or phenomenon under study.

Methods: Common methods include multiple regression analysis, principal component analysis (PCA), factor analysis, cluster analysis, and machine learning techniques like decision trees, random forests, and neural networks. These methods enable the exploration of complex interactions and dependencies among multiple variables.

corr=df.corr() # Finding the co relation between all the fields in the dataset and storing it in the variable 'corr'.
